

ABSTRACT

2 A storage unit having a back panel, a top panel attached to the back panel, a
3 bottom panel attached to the back panel, a pair of opposing side panels attached to
4 the back, top and bottom panels so as to define a housing having an interior, and a
5 plurality of shelf members positioned within the interior of the housing and arranged
6 in a vertically oriented fashion. The shelf members are removably mounted to the
7 back panel and opposing side panels. The storage unit further comprises a plurality
8 of divider members removably positioned between (i) each pair of consecutive shelf
9 members, (ii) the top panel and an uppermost shelf member and (iii) the bottom
10 panel and a lowermost shelf member. The divider members define a plurality of
11 compartments. In one embodiment, the compartments function as drawer-receiving
12 spaces wherein each drawer-receiving space is sized for receiving a corresponding
13 drawer. Each divider member can be repositioned to provide compartments of
14 varying sizes.
